**BHCS Falls Safety Measures:**

Our falls drill down showed most falls being bathroom related. Staff are encouraged to ensure this is addressed during their purposeful rounding. Reinforce with staff that patient's should not be left unattended on the bedside commode. Continue to encourage and reinforce the need for purposeful rounding. Continue to educate on the Morse Fall Risk Scale Score. Continue to reinforce the need for thorough and proper patient assessment and handoff. Safety Huddles every shift with staff (to review any fall risk patients and any other safety concerns). Reinforce the need for bedside shift report. Medications review by decentralized pharmacists post-fall, feedback provided and medication(s) adjusted accordingly. All patient's receiving sedatives prior to a procedure, should be transported via stretcher, not wheelchair. Safety sitters are assigned to non compliant patients with high risk for falls. I-Care rounding should also include ensuring Fall preventative measures are in place(functional bed alarm, bed plugged in, nonskid socks, yellow bracelet, environment clutter free and no environmental hazards). More front line staff encouraged to attend falls meeting, multidisciplinary approach. Falls Road Show- Risk & Quality round on units/departments throughout the hospital with a Spin Wheel created just for Falls. Staff are quizzed on fall related questions and are rewarded with snacks. IA/RCA for each fall with a severity level >3. Use of standardized Intense falls analysis form - this allows the staff the opportunity to provide a more detailed drill down of the event.

**ACHA ANNUAL REPORTABLE EVENTS:**

There were 3 ACHA Annual Reportable Events in the 2nd Quarter CY 2023:

**1 - Clavicle - Fracture - Birth (Labor and Delivery):**

Newborn, assessed by physician who recognized weakness in the left arm with no obvious fracture at time of birth. It was a difficult birth, but no shoulder dystocia was identified. A left non-displaced clavicle fracture was identified on x-ray. Appropriate care and treatment was initiated. This was sent to Quality for review.

**1 - Procedure Complication (Surgery - GI/Endo):**

Patient is a 57 yr. old female that was scheduled for colonoscopy and EGD for Anemia. On 04/25/2023, during the procedure, some Arteriovenous Malformations (AVMs) were found in the caecum and ascending colon, and they were treated with argon plasma coagulation. The patient had abdominal pain in the recovery room and a KUB was done, which revealed a *Pneumoperitoneum*. Surgery was consulted and patient underwent an emergent laparotomy. Preop Diagnosis: Bowel perforation. Postop Diagnosis: Open right hemicolectomy, abdominal washout. This was sent to Quality for review.

**1 - Fetal/Maternal Demise (Labor and Delivery):**

On 04/28/2023 - 35 year old female patient arrived and was seen in L&D triage with C/O contractions, but no vaginal bleeding. She received prenatal care at Pompano clinic. Pt is a gravida 2 Para 0, and had a previous C/S. Patient was placed on continuous monitoring and the OBGYN was informed of the patient arrival and complaint of contractions.

An U/s was done and the OBGYN was notified of the results: (BPP 8/8, heart rate of 140 with AFI of 19.3 and with lower segment of the uterus poorly visualized and thin, no sign of free fluid, patient hemodynamically stable). Betamethasone was administered. U/S results discussed with patient.

Orders received from OBGYN for discharge @1707. Patient was discharged to home and education was provided to return next day for dose # 2 of Betamethasone.

04/29/2023, @0545, patient returned to triage via EMS complaining of contractions and spotting. Patient was placed on FM/TOCO; however staff were unable to find any fetal heart tone. An order was placed for a STAT ultrasound and based on the findings a STAT C/S was done.

At the time of the delivery, the infant was handed over to the NICU team for resuscitative measures due to the infant being cyanotic, no spontaneous respiration and no heart rate. The infant was intubated successfully, and CPR continued. Pupils were fixed and dilated and CPR discontinued after no response.

Indications for surgery: non-reassuring fetal wellbeing.

Post op-diagnosis: Uterine rupture with fetal and placental expulsion intra-abdominal

Surgical procedure: Laparotomy with delivery of fetus and placenta with repair of uterine rupture

Blood loss: 821 mls

This case was sent to Quality for review.
