Expected losses

Expected losses are calculated by applying the expected loss rate to the member's payroll relevant to the mod effective date.

Actual losses

Actual losses are the losses the member incurred during the rating period. Basically, a debit will be applied if the actual losses exceed the expected losses (mod will be greater than 1.0) and a credit will be applied if the actual losses are less than the expected losses (mod will be less than 1.0).

Computed Factors

The ballast factor and weighting factor both come from a formula based on the amount of the member's expected losses. Both have a stabilizing effect on the experience mod.

This mod has been adjusted in accordance with experience rating plan rules. The unadjusted mod is: .97

* Rating reflects a decrease of 70% medical-only primary and excess loss dollars where ERA is applied, reflected in totals (E), (G) and (H).

This mod has been adjusted in accordance with experience rating plan rules. The unadjusted mod is: .97

Loss Analysis by Policy Period

The graph below compares actual and expected losses in the three-year rating period. The direction of future experience mods can be predicted using this information and comparing it to the years included in a given rating period. For example, if an undesirable policy period – a year that actual losses exceed the expected losses – is dropped from the three-year rating calculation, the member can expect to see an improvement in the mod if a more desirable policy period – one where the actual losses are less than expected – is added to the calculation. Assistance in achieving this outcome can be provided by loss control efforts.

Policy Period	Adjusted Losses	Expected Losses
